/note="Vector: BA vector; Site_1: Not1; Site_2: HindIII;
/note="Vector: BA vector was and female adult worms was
extracted according to a modification (Puissant, C. and
Houdebine, L. M. BioFeedback 8, 148-149, 1990) of the
Guanidine Thiocyanate procedure (Chomczynski, P. and
Sacchi, N. Anal. Biochem. 162, 156-159, 1987). Poly (A)+
RNA was purified by Oligo dT column and cDNA was
synthesized as described previously (Adams, M. D. et al.
Nature Genet. 4, 373-389, 1993). cDNA was ligated to a
two fold molar excess of a NotI/HindIII digested plasmid
DNA (lafmid BA vector, a phagemid derived from pEMBL,
Adams, M. D. et al. Nature Genet. 4, 373-389, 1993)) and
electroporated into E. coli strain DH10B (BRL). The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              two fold molar excess of a NotI/HindIII digested plasmid DNA (lafmid BA vector, a phagemid derived from pEMBL, Adams, M. D. et al. Nature Genet. 4, 373-389, 1933) and electroporated into E. coli strain DH10B (BRL). The library was amplified and further selected for clones containing long inserts (>500 bp) by purification of the plasmid DNA from a fragment of a 1% low-melting-point agarose gel, containing the smear of the library and electroporation into DH10B cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GI:529730

(streptomycin), embB (ethambutol), pncA (pyrazinamide), gyrA
(ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis.
(These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample.

The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/s12
(and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/sl2 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the
                                                                                          Bodmer T,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              rpoB (rifampin resistance) gene sequencing primer rpoB-3s (bp 2611-2592). It is used with the forward primer given in AAA49825 and with the amplification primers given in AAA49823 and AAA49824 for the detection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49833-62) have been developed for the detection and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR amplification was used to obtain rpoB genes from rifampicin-resistant Mycobacterium leprae strains. A comparison with the sequence of the rpoB gene from sensitive strains (AAQ51532) reveal mutations in the region encoding amino acids 400-450. The corresp. region was isolated from M.tuberculosis (AAQ61457). A common mutation seen in resistant strains occurs at codon 425 where Ser is substituted, most frequently by Leu.
rpoB (rifampin resistance) gene (bp2161-2640). Amplification cycle sequencing primers (see AAA49823-62) are used for the de and analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isonizzid), oxyR-aph (isonizzid), mabA (isonizzid), rpsL/s12 (streptomycin), 16S/rr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rapid detection of antiblotic resistance in Mycobacteria - esp. isoniazid, rifampicin or streptomycin resistance in tuberculosis by detecting mutation in katG, rpoB or rpsL genes
                                                                                    Disclosure;

These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpos, katG, rpsL/s12 and 23s genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as the state of the sensitive and accurate providing information as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter.

Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, respecially hepatitis C virus (HCV) and simian immunodeficiency virus (SIV). Two primers (AAT29123, MAT29123) were used to amplify a 620 bp region of the Mycobacterium tuberculosis rpoB gene, which, when mutated is associated with rifampin resistance. The 620 bp region amplified spans both the H451Y and $456L mutations. The amplified
            polymerase, Escherichia coll Exolli und in Complex. The nucleic acid substrate is preferably nationucleotide containing a human p53 gene sequence or containing a huma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    compared to the cleavage products of reference gene sequences. The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter. Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus (HCV) and simian immunodeficiency virus (SIV). Two primers (AAT29122, AAT29123) were used to amplify a 620 bp region of the Mycobacterium tuberculosis rpoB gene, which, when mutated is associated with rifampin resistance. The 620 bp region amplified spans both the H451Y and S456L mutations. The amplified fragments are given in AAT29124 (Wild type) and AAT29125-26 (mutant sequences).

                                                                     This oligonucleotide DNA primer is specific for Mycobacterium tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rpoB. The 1st several bases comprise nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M. tuberculosis and the concurrent determination of its drug susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.
                                                                                                                                                                                                                         Detection of Mycobacterium tuberculosis - by amplifying sample DNA with a primer set that targets portions of the gene encoding rpoB.

                                                                                                                                                                                                                                                                          polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polypucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of an organism.

cc acids of determined algal, archaeal, bacterial, fungal and parasitical consecuency with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more created microorganisms e.g. algae, archaea, bacteria, fungi and centerial probes and/or primers for detecting one or more consistency for universal detection and for specific and ubiquitous constants. The method of an algala, archaeal, bacterial, fungi and centerial precise, genus, family and group. A nucleic acid (I) contained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the centerion of at least one antimicrobial agent resistance gene or at least one toxin gene. hexa nucleic acids are used for the specific and ubiquitous detection and for identification of Streptococcus pneumoniae. (I) can be used to design a therapeutic agent which is effective against conformation of the design at therapeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group corynebacterium sp., Enterobacteriaceae group, Escherichia coli, con be used to design at therapeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group corynebacteriaceae family, Pseudomonads group, Escherichia coli, coling but a detected include Abiotrophia adiacens, Bordetella sp., colong the specific and coling the series and staphylococcus sp. Using DNA based tests provides faster results than substrate specificity tests as results can be a converted to the colong test and termined.

                                                                                                                                             Neisseria gonorrhoeae and Staphylococcus sp.. Using DNA based tests provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved. AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Species Species, your indentification; paragraphic identification; algal; archaeal; bacterial; rungal; paragraphic identification; diagnosis; translation elongation factor G; RecA recombinase; resistance; translation elongation factor G; RecA recombinase; antimicrobial;

                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the rpoB gene from Mycobacterium tuberculosis. Rifampin resistance is largely associated with point mutations localised in a small core region of 81 base pairs in the rpoB gene, which encodes the RNA polymerase beta subunit. To detect a mutation, a complex is formed comprising a first sequence representing the predetermined region of the gene of the organism and a second sequence representing the corresponding region of the gene of the wild type organism in double stranded form. Each member of at least one pair of non-complementary trands within the complex has a label. The association of the labels in the complex is related to the presence of the mutation. The presence of

The method comprises detecting the presence of a least 1 mutation in a first sequence and relating the presence of the mutation to drug resistance. Included in the invention are a kit for carrying out the method and a method for detecting the presence of a difference between two related nucleic acid sequences in an organism. I methods are useful for detecting resistance to drugs such rifampin and pyrazinamide in Mycobacterium. The present sequence represents the Mycobacterium tuberculosis rpoB gene (which encodes the RNA polymerase beta subunit). The sequence is used in an example of the method of the invention for the detection of rifampin resistance in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting resistance of drugs such as rifampicin in strains {\tt Mycobacterium}, comprising detecting mutations in a gene and them to drug resistance -

The method is partic. useful for the detection of rifampicin and/or rifabutin resistance in M. leprae or M. tuberculosis, and mycobacterial spp. identification. The method is rapid and reliable and provides simultaneous determn.

A common mutation seen in resistant strains occurs at codon 425 where Ser is substituted, most frequently by Leu.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR amplification was used to obtain rpoB genes from rifampicin-
resistant Mycobacterium leprae strains. A comparison with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rapid detection of antibiotic resistance in Mycobacteria - isoniazid, rifampicin or streptomycin resistance in tubercuby detecting mutation in katG, rpoB or rpsL genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            P-PSDB;

The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antiblotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets CC for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. CC and to obtain antibodies capable of binding to the expressed proteins. CC The proteins can be used to screen compounds in rational drug discovery CC programmes. The antisense nucleic acid sequence is also useful to screen CC for homologous nucleic acids which are required for cell proliferation in CC awide variety of organisms. The present sequence encodes an CC essential prokaryotic cellular proliferation protein. CC Note: The sequence data for this patent did not form part CC format directly from WIPO at CC format directly from WIPO at

                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
